#### 1 SYNTAX AND SEMANTICS

# 1.1 Abstract Syntax

```
\begin{array}{rcll} \text{Identifiers} & x & \in & \text{Var} \\ \text{Expression} & e & \rightarrow & x \mid \lambda x.e \mid e \ e & \lambda\text{-calculus} \\ & \mid & e \rtimes e & \text{linked expression} \\ & \mid & \varepsilon & \text{empty module} \\ & \mid & x = e \ ; \ e & \text{(recursive) binding} \end{array}
```

A Simple Abstract Interpretation Framework for Modular

Fig. 1. Abstract syntax of the language.

# 1.2 Operational Semantics

```
Environment
                        \in
                             Env
                            Loc \triangleq \{infinite set of locations\}
     Location \ell
        Value v
                            Val \triangleq Env + Var \times Expr \times Env
                        \in WVal \triangleq Val + Loc × Val
 Weak Value w
Environment
                                                                     empty stack
                                                                     free location binding
                             (x,\ell)::\sigma
                                                                     weak value binding
                             (x, w) :: \sigma
        Value
                                                                     exported environment
                             \langle \lambda x.e, \sigma \rangle
                                                                     closure
 Weak Value w
                                                                     value
                                                                     recursive value
                             \mu\ell.v
```

Fig. 2. Definition of the semantic domains.

#### 1.3 Reconciling with Conventional Backpatching

The semantics in Figure 3 makes sense due to similarity with a conventional backpatching semantics as presented in Figure 5. We have defined a relation  $\sim$  that satisfies:

```
\sim \subseteq WVal \times (MVal \times Mem \times \mathcal{P}(Loc)) \bullet \sim (\bullet, \emptyset, \emptyset)
```

 $\sigma \vdash e \Downarrow v$ 

Fig. 3. The big-step operational semantics.

Fig. 4. Definition of the semantic domains with memory.

# and the following theorem:

Theorem 1.1 (Equivalence of Semantics). For all  $\sigma \in \text{Env}$ ,  $\sigma' \in \text{MEnv} \times \text{Mem} \times \mathcal{P}(\text{Loc})$ ,  $v \in \text{Val}$ ,  $v' \in \text{MVal} \times \text{Mem} \times \mathcal{P}(\text{Loc})$ , we have:

$$\sigma \sim \sigma'$$
 and  $\sigma \vdash e\sigma \vdash e \Downarrow vv \Rightarrow \exists v' : v \sim v'$  and  $\sigma' \vdash e\sigma \vdash e \Downarrow vv'$   
 $\sigma \sim \sigma'$  and  $\sigma' \vdash e\sigma \vdash e \Downarrow vv' \Rightarrow \exists v : v \sim v'$  and  $\sigma \vdash e\sigma \vdash e \Downarrow vv$ 

The actual definition for  $\sim$  can be found in the appendix.

$$\frac{\text{Link}}{\sigma, m, L \vdash e_1 \Downarrow \sigma_1, m_1, L_1 \qquad \sigma_1, m_1, L_1 \vdash e_2 \Downarrow v, m', L'}{\sigma, m, L \vdash e_1 \bowtie e_2 \Downarrow v, m', L'} \qquad \frac{\text{Empty}}{\sigma, m, L \vdash \varepsilon \Downarrow \bullet, m, L}$$

$$\frac{\text{Bind}}{\ell \notin \text{dom}(m) \cup L \qquad (x,\ell) :: \sigma, m, L \cup \{\ell\} \vdash e_1 \Downarrow v_1, m_1, L_1}{(x,\ell) :: \sigma, m_1[\ell \mapsto v_1], L_1 \vdash e_2 \Downarrow \sigma_2, m', L'}$$
$$\frac{\sigma, m, L \vdash x = e_1; e_2 \Downarrow (x,\ell) :: \sigma_2, m', L'}{\sigma, m, L \vdash x = e_1; e_2 \Downarrow (x,\ell) :: \sigma_2, m', L'}$$

Fig. 5. The big-step operational semantics with memory.

#### 2 GENERATING AND RESOLVING EVENTS

Now we formulate the semantics for generating events.

Fig. 6. Definition of the semantic domains with events. All other semantic domains are equal to Figure 2.

We extend how to read weak values given an environment.

$$\bullet(x) \triangleq \bot \qquad ((x', \ell) :: \sigma)(x) \triangleq (x = x'?\ell : \sigma(x))$$

$$[E](x) \triangleq \text{Read}(E, x) \qquad ((x', w) :: \sigma)(x) \triangleq (x = x'?w : \sigma(x))$$

Then we need to add only one rule to the semantics in Figure 3 for the semantics to incorporate events.

$$\frac{A\text{PPEVENT}}{\sigma \vdash e_1 \Downarrow E} \quad \sigma \vdash e_2 \Downarrow v$$
$$\frac{\sigma \vdash e_1 e_2 \Downarrow Call(E, v)}{\sigma \vdash e_1 e_2 \Downarrow Call(E, v)}$$

Now we need to formulate the *concrete linking* rules. The concrete linking rule  $\sigma_0 \propto w$ , given an answer  $\sigma_0$  to the lnit event, resolves all events within w to obtain a set of final results.

Concrete linking makes sense because of the following theorem. First define:

$$\mathrm{eval}(e,\sigma) \triangleq \{v \mid \sigma \vdash e \Downarrow v\} \qquad \mathrm{eval}(e,\Sigma) \triangleq \bigcup_{\sigma \in \Sigma} \mathrm{eval}(e,\sigma) \qquad \sigma_0 \propto W \triangleq \bigcup_{w \in W} (\sigma_0 \propto w)$$

Then the following holds:

Theorem 2.1 (Soundness of concrete linking). Given  $e \in \text{Expr}$ ,  $\sigma \in \text{Env}$ ,  $v \in \text{Val}$ ,

$$\forall \sigma_0 \in \text{Env} : \text{eval}(e, \sigma_0 \times \sigma) \subseteq \sigma_0 \times \text{eval}(e, \sigma)$$

Fig. 7. Definition for concrete linking.

#### 3 TYPING

The definitions for types are in Figure 8 and the typing rules are in Figure 9.

Fig. 8. Definition of types.

$$\begin{array}{c} \text{T-ID} & \text{T-FN} \\ \Gamma(x) = \tau \\ \hline \Gamma \vdash x : \tau, \{x\} \end{array} \qquad \begin{array}{c} \text{T-FN} \\ \Gamma \vdash x : \tau, \{x\} \end{array} \qquad \begin{array}{c} \text{T-APP} \\ \hline \Gamma \vdash x : \tau, \{x\} \end{array} \qquad \begin{array}{c} \text{T-APP} \\ \hline \Gamma \vdash x : \tau, \{x\} \end{array} \qquad \begin{array}{c} \text{T-APP} \\ \hline \Gamma \vdash x : \tau, \{x\} \end{array} \qquad \begin{array}{c} \text{T-APP} \\ \hline \Gamma \vdash x : \tau, \{x\} \end{array} \qquad \begin{array}{c} \text{T-LINK} \\ \hline \Gamma \vdash e_1 : E^\#, S_1 \qquad \Gamma \vdash e_2 : \tau, S_2 \\ \hline \Gamma \vdash e_1 : E^\#, S_1 \qquad \Gamma \vdash e_2 : \tau, S_2 \end{array} \qquad \begin{array}{c} \text{T-LINK} \\ \hline \Gamma \vdash e_1 : \Gamma_1, S_1 \qquad \Gamma_1 \vdash e_2 : \tau_2, S_2 \\ \hline \Gamma \vdash e_1 : e_2 : \tau_2, S_1 \cup S_2 \end{array} \qquad \begin{array}{c} \text{T-NIL} \\ \hline \Gamma \vdash e_1 : \tau, S_1 \quad \Gamma_1 \vdash e_2 : \tau, S_2 \end{array} \qquad \begin{array}{c} \text{T-NIL} \\ \hline \Gamma \vdash x : \bullet, \emptyset \end{array}$$

Fig. 9. The typing judgment.

#### 3.1 Type Safety

Theorem 3.1 (Type Safety). For all  $e \in \text{Expr}$ , if  $\bullet \vdash e : \tau$  for some  $\tau$ , then there exists some  $v \in \text{Val}$  such that  $\bullet \vdash e \parallel v$ .

Sketch. We prove this through unary logical relations and induction on the typing judgment.

# Event Relation

$$\mathcal{E}[\![E^\#]\!]\rho$$

$$\mathcal{E}[\![\mathsf{Init}^{\#}]\!]\rho \triangleq \{\mathsf{Init}\}$$

$$\mathcal{E}[\![\mathsf{Read}^{\#}(E^{\#},x)]\!]\rho \triangleq \{\mathsf{Read}(E,x)|E \in \mathcal{E}[\![E^{\#}]\!]\rho\}$$

$$\mathcal{E}[\![\mathsf{Call}^{\#}(E^{\#},\tau)]\!]\rho \triangleq \{\mathsf{Call}(E,v)|E \in \mathcal{E}[\![E^{\#}]\!]\rho \wedge v \in \mathcal{V}[\![\tau]\!]\rho\}$$

# **Context Relation**

$$C[\![\bullet]\!] \rho \triangleq \{\bullet\}$$

$$C[\![(x,\tau) :: \Gamma]\!] \rho \triangleq \{(x,w) :: \sigma | w \in W[\![\tau]\!] \rho \land \sigma \in C[\![\Gamma]\!] \rho\}$$

$$\cup \{(x,\ell) :: \sigma | \rho(\ell) = \tau \land \sigma \in C[\![\Gamma]\!] \rho\}$$

$$C[\![[E^{\#}]\!] \rho \triangleq \{[E] | E \in E[\![E^{\#}]\!] \rho\}$$

# **Value Relation**

$$\mathcal{V}[\![\tau_1 \xrightarrow{S} \tau_2]\!] \rho \triangleq \{\langle \lambda x.e, \sigma \rangle | \forall v \in \mathcal{V}[\![\tau_1]\!] \rho : (e, (x, v) :: \sigma, S) \in \mathcal{X}[\![\tau_2]\!] \rho \}$$

# **Weak Value Relation**

$$\mathcal{W}[\![\tau]\!]\rho\triangleq\mathcal{V}[\![\tau]\!]\rho\cup\{\mu\ell.v|v\in\mathcal{V}[\![\tau]\!]\rho[\ell\mapsto\tau]\}$$

# **Expression Relation**

$$\mathcal{X}[\![\tau]\!]\rho\triangleq\{(e,\sigma,S)|\mathrm{unsafe}(\sigma)\cap S=\varnothing\Rightarrow\mathrm{eval}(e,\sigma)\subseteq\mathcal{V}[\![\tau]\!]\rho\}$$

# **Semantic Typing**

$$\Gamma \models e : \tau, S \triangleq \forall \rho, \sigma \in C \llbracket \Gamma \rrbracket \rho : (e, \sigma, S) \in X \llbracket \tau \rrbracket \rho$$

We prove

$$\Gamma \vdash e : \tau, S \Rightarrow \Gamma \models e : \tau, S$$

by induction on  $\vdash$ .
