1 For the Simple Module Language

Figure 1: Abstract syntax of the simple module language.

1.1 Operational Semantics

Figure 2: Definition of the semantic domains.

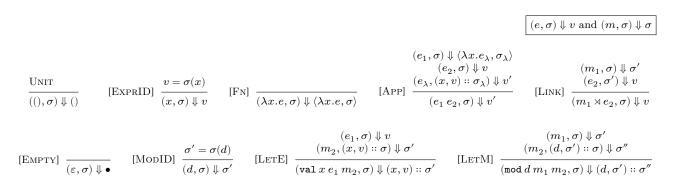

Figure 3: The big-step operational semantics.

1.2 Typing

The definitions for types are in Figure 4 and the typing rules are in Figure 5.

1.3 Type Safety

Claim 1.1 (Type Safety). For all $e \in \text{Expr}$, if $\bullet \vdash e : \tau$ for some τ , then there exists some $v \in \text{Val}$ such that $(e, \bullet) \Downarrow v$. Likewise, if $\bullet \vdash m : \Gamma$ for some Γ , then there exists some $\sigma \in \text{Ctx}$ such that $(m, \bullet) \Downarrow \sigma$.

Figure 4: Definition of types.

$$[\text{Unit}] \ \frac{\Gamma \vdash e : \tau \text{ and } \Gamma \vdash m : \Gamma}{\Gamma \vdash () : \iota} \\ [\text{Empty}] \ \frac{\tau = \Gamma(x)}{\Gamma \vdash (x : \tau)} \\ [\text{Empty}] \ \frac{\tau = \Gamma(x)}{\Gamma \vdash (x : \tau)} \\ [\text{Empty}] \ \frac{\tau = \Gamma(x)}{\Gamma \vdash (x : \tau)} \\ [\text{Empty}] \ \frac{\tau = \Gamma(x)}{\Gamma \vdash (x : \tau)} \\ [\text{Empty}] \ \frac{\tau = \Gamma(x)}{\Gamma \vdash (x : \tau)} \\ [\text{Empty}] \ \frac{\tau = \Gamma(x)}{\Gamma \vdash (x : \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)} \\ [\text{Empty}] \ \frac{\tau \vdash (x, \tau)}{\Gamma \vdash (x, \tau)$$

Figure 5: The typing judgment.

Proof sketch. We prove this through unary logical relations and induction on the typing judgment.

Value Relation
$$\begin{array}{c} \mathcal{V}[\![\tau]\!] & \triangleq \\ \mathcal{V}[\![\tau_1]\!] & \vdash \\ \mathcal{V}[\!$$

We want to prove that:

$$\Gamma \vdash e : \tau \Rightarrow \Gamma \vDash e : \tau$$

$$\Gamma \vdash m : \Gamma' \Rightarrow \Gamma \vDash m : \Gamma'$$

by induction on \vdash .

For the base cases of ι and \bullet , the proof is trivial. For inductive cases, we need to show *compatibility* lemmas. That is, we must show that the typing rules for syntactic typing hold for semantic typing as well. Then by the inductive hypothesis and compatibility, the result follows.

1.4 Type Inference

For the simple module language, the operational semantics constrains which expressions must evaluate to contexts and which expressions must evaluate to closures. Therefore, type inference in this language is simple, as the shape of the typing environment can be accurately inferred from the syntax of the program.

First we define the syntax for type constraints.

Figure 6: Definition of type constraints.

Next we define the module access operation $\Gamma(d)$ and the type access operation $\Gamma(x)$:

Now we can define the constraint generation algorithms $V_1(\Gamma, e, \alpha)$ and $V_2(\Gamma, m)$. Note that the **let** U = **in** _ notation returns \bot if the right hand side is \bot . Likewise, the **let** $(\Gamma, U) =$ **in** _ notation returns \bot if the right hand side is \bot .

$$\boxed{V_1(\Gamma,e,\alpha)=U \text{ and } V_2(\Gamma,m)=(\Gamma,U)}$$

We want to prove that the constraint generation algorithm is correct.

First, for $\Gamma_{\text{ext}} \in \text{TyEnv}$, define the access operations $\Gamma_{\text{ext}}.p$ and $\Gamma_{\text{ext}}.p.x$ (which may fail):

$$\Gamma_{\rm ext}.\epsilon \triangleq \Gamma_{\rm ext} \qquad \qquad \Gamma_{\rm ext}.pd \triangleq (\Gamma_{\rm ext}.p)(d) \qquad \qquad \Gamma_{\rm ext}.p.x \triangleq (\Gamma_{\rm ext}.p)(x)$$

and define the injection operations $\Gamma[\Gamma_{\rm ext}]$ and $\tau[\Gamma_{\rm ext}]$:

$$\begin{split} (\bullet)[\Gamma_{\mathrm{ext}}] &\triangleq \bullet & ((x,\tau) :: \Gamma)[\Gamma_{\mathrm{ext}}] \triangleq (x,\tau[\Gamma_{\mathrm{ext}}]) :: \Gamma[\Gamma_{\mathrm{ext}}] \\ ((d,\Gamma) :: \Gamma')[\Gamma_{\mathrm{ext}}] &\triangleq (d,\Gamma[\Gamma_{\mathrm{ext}}]) :: \Gamma'[\Gamma_{\mathrm{ext}}] \\ (\iota)[\Gamma_{\mathrm{ext}}] &\triangleq \iota & ([].p)[\Gamma_{\mathrm{ext}}] \triangleq \Gamma_{\mathrm{ext}}.p \\ (\alpha)[\Gamma_{\mathrm{ext}}] &\triangleq \alpha & ([].p.x)[\Gamma_{\mathrm{ext}}] \triangleq \Gamma_{\mathrm{ext}}.p.x \end{split}$$

Let Subst \triangleq TyVar $\xrightarrow{\text{fin}}$ Type be the set of substitutions. For $S \in$ Subst, define:

Define:

$$(S, \Gamma_{\text{ext}}) \models U \triangleq \forall (\tau_1 \doteq \tau_2) \in U : (S\tau_1)[\Gamma_{\text{ext}}] = (S\tau_2)[\Gamma_{\text{ext}}]$$

Then we can show that:

Claim 1.2 (Correnctness of V). For $e \in \text{Expr}$, $m \in \text{Module}$, $\Gamma, \Gamma_{\text{ext}} \in \text{TyEnv}$, $\alpha \in \text{TyVar}$, $S \in \text{Subst}$:

$$\begin{split} (S,\Gamma_{\mathrm{ext}}) \vDash U \Leftrightarrow & (S\Gamma)[\Gamma_{\mathrm{ext}}] \vdash e: (S\alpha)[\Gamma_{\mathrm{ext}}] \\ (S,\Gamma_{\mathrm{ext}}) \vDash U \Leftrightarrow & (S\Gamma)[\Gamma_{\mathrm{ext}}] \vdash m: (S\Gamma')[\Gamma_{\mathrm{ext}}] \end{split} \qquad \text{when } V_1(\Gamma,e,\alpha) = U$$

Proof sketch. Mutual induction on e, m.

Note that by including [].p in type environments, we can naturally generate constraints about the external environment []. Also, by injection, we can utilize constraints generated in advance to obtain constraints generated from a more informed environment. We extend injection to the output of the constraint-generating algorithm:

П

$$\begin{split} & \bot[\Gamma_{\text{ext}}] \triangleq \bot \\ & U[\Gamma_{\text{ext}}] \triangleq \{\tau_1[\Gamma_{\text{ext}}] \doteq \tau_2[\Gamma_{\text{ext}}] | (\tau_1 \doteq \tau_2) \in U\} \\ & U[\Gamma_{\text{ext}}] \triangleq \bot \\ & (\Gamma, U)[\Gamma_{\text{ext}}] \triangleq (\Gamma[\Gamma_{\text{ext}}], U[\Gamma_{\text{ext}}]) \end{split} \qquad \text{when all injections succeed}$$

Then we can prove:

Claim 1.3 (Advance). For $e \in \text{Expr}$, $m \in \text{Module}$, $\Gamma, \Gamma_{\text{ext}} \in \text{TyEnv}$, $\alpha \in \text{TyVar}$:

$$\begin{split} V_1(\Gamma[\Gamma_{\text{ext}}], e, \alpha) &= V_1(\Gamma, e, \alpha) [\Gamma_{\text{ext}}] \\ V_2(\Gamma[\Gamma_{\text{ext}}], m) &= V_2(\Gamma, m) [\Gamma_{\text{ext}}] \end{split}$$

Proof sketch. Structural induction on Γ .

2 For the Language with First-Class Modules

Figure 7: Abstract syntax of the language where modules are first-class.

2.1 Operational Semantics

Figure 8: Definition of the semantic domains.

2.2 Typing

The definitions for types are in Figure 10 and the typing rules are in Figure 11. The definitions for subtyping are in Figure 12.

 $(e,\sigma) \Downarrow v$

$$[\text{ID}] \ \frac{v = \sigma(x)}{(x,\sigma) \Downarrow v} \qquad [\text{FN}] \ \frac{(e_1,\sigma) \Downarrow \langle \lambda x. e_\lambda, \sigma_\lambda \rangle}{(e_2,\sigma) \Downarrow v} \qquad [\text{Link}] \ \frac{(e_1,\sigma) \Downarrow \sigma'}{(e_2,\sigma') \Downarrow v} \\ [\text{Empty}] \ \frac{(e_1,\sigma) \Downarrow \sigma'}{(\varepsilon,\sigma) \Downarrow \bullet} \qquad [\text{Bind}] \ \frac{(e_1,\sigma) \Downarrow v}{(e_2,(x,v) :: \sigma) \Downarrow \sigma'} \\ [\text{Empty}] \ \frac{(e_1,\sigma) \Downarrow v}{(\varepsilon_2,(x,v) :: \sigma) \Downarrow \sigma'}$$

Figure 9: The big-step operational semantics.

Figure 10: Definition of types.

 $\Gamma \vdash e : \tau$

$$\text{[ID]} \ \frac{\tau = \Gamma(x)}{\Gamma \vdash x : \tau} \qquad \text{[FN]} \ \frac{(x,\tau_1) :: \Gamma \vdash e : \tau_2}{\Gamma \vdash \lambda x.e : \tau_1 \to \tau_2} \qquad \text{[APP]} \ \frac{ \begin{array}{c} \Gamma \vdash e_1 : \tau_1 \to \tau \\ \Gamma \vdash e_2 : \tau_2 \\ \hline \Gamma \vdash e_1 e_2 : \tau \end{array} }{ \Gamma \vdash e_1 e_2 : \tau} \qquad \text{[LINK]} \ \frac{ \begin{array}{c} \Gamma \vdash e_1 : \Gamma_1 \\ \Gamma_1 \vdash e_2 : \tau_2 \\ \hline \Gamma \vdash e_1 \rtimes e_2 : \tau_2 \end{array} }{ \Gamma \vdash e_1 \rtimes e_2 : \tau_2}$$

Figure 11: The typing judgment.

 $au \geq au$

$$[\text{EMPTY}] \ \frac{\Gamma(x) \geq \tau}{\bullet \geq \bullet} \qquad [\text{BIND}] \ \frac{\Gamma(x) \geq \tau}{\Gamma - x \geq \Gamma'} \qquad [\text{FN}] \ \frac{\tau_2 \geq \tau_1}{\tau_1' \geq \tau_2'} \\ \frac{\Gamma \geq (x, \tau) :: \Gamma'}{\Gamma \geq (x, \tau) :: \Gamma'} \qquad [\text{FN}] \ \frac{\tau_2 \geq \tau_1}{\tau_1 \geq \tau_2'}$$

Figure 12: The subtype relation.

2.3 Type Safety

Claim 2.1 (Type Safety). For all $e \in \text{Expr}$, if $\bullet \vdash e : \tau$ for some τ , then there exists some $v \in \text{Val}$ such that $(e, \bullet) \Downarrow v$.

Proof sketch. We prove this through unary logical relations and induction on the typing judgment.

 $\Gamma \vdash e : \tau \Rightarrow \Gamma \vDash e : \tau$

by induction on \vdash .

For the base case of •, the proof is trivial. For inductive cases, we need to show *compatibility* lemmas. That is, we must show that the typing rules for syntactic typing hold for semantic typing as well. For this, we need the *subtyping* lemma:

$$\tau_1 \geq \tau_2 \Rightarrow \mathcal{V}[\![\tau_1]\!] \supseteq \mathcal{V}[\![\tau_2]\!]$$

Then by the inductive hypothesis and compatibility, the result follows.

2.4Type Inference

When modules are first-class, type variables can go in the place of type environments. First we define the syntax for type constraints.

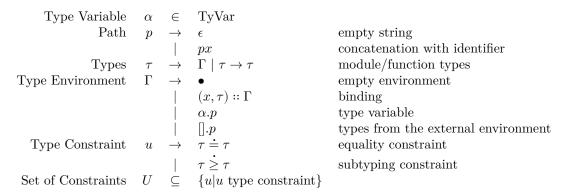

Figure 13: Definition of type constraints.

Next we define the type access operation $\tau(x)$:

$$\bullet(x) \triangleq \bot \qquad \qquad (\alpha.p)(x) \triangleq \alpha.px \\ ((x,\tau) :: _)(x) \triangleq \tau \qquad \qquad ([].p)(x) \triangleq [].px \\ ((x',_) :: \Gamma)(x) \triangleq \Gamma(x) \qquad \text{when } x' \neq x \qquad (_ \to _)(x) \triangleq \bot$$

Now we can define the constraint generation algorithm $V(\Gamma, e, \alpha)$. Note that the **let** $U = \underline{\quad}$ in $\underline{\quad}$ notation returns \perp if the right hand side is \perp . Also note that we write α for $\alpha.\epsilon$ as well.

$$V(\Gamma, e, \alpha) = U$$

$$V(\Gamma, \varepsilon, \alpha) \triangleq \{\alpha \doteq \bullet\} \qquad V(\Gamma, e_1 \rtimes e_2, \alpha) \triangleq \begin{cases} V(\Gamma, e, \alpha) = U \end{cases}$$

$$V(\Gamma, \varepsilon, \alpha) \triangleq \{\alpha \doteq \bullet\} \qquad V(\Gamma, e_1 \rtimes e_2, \alpha) \triangleq \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \\ V(\Gamma, \alpha) \triangleq (1 + 1) \end{cases} \triangleq \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \\ V(\Gamma, \alpha) \triangleq (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha) \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha \Rightarrow (1 + 1) \end{cases} \Rightarrow \begin{cases} V(\Gamma, e_1 \rtimes e_2, \alpha \Rightarrow (1 + 1) \end{cases} \Rightarrow (1 +$$

We want to prove that the constraint generation algorithm is correct. First, for $\tau \in \text{Type}$, define the access operation τp (which may fail):

$$\tau \cdot \epsilon \triangleq \tau$$

$$\tau \cdot px \triangleq (\tau \cdot p)(x)$$

and define the injection operation $\tau[\Gamma_{\text{ext}}]$:

$$\begin{aligned} (\bullet)[\Gamma_{\mathrm{ext}}] &\triangleq \bullet \\ (\alpha.p)[\Gamma_{\mathrm{ext}}] &\triangleq \alpha.p \end{aligned} \qquad ((x,\tau) :: \Gamma)[\Gamma_{\mathrm{ext}}] \triangleq (x,\tau[\Gamma_{\mathrm{ext}}]) :: \Gamma[\Gamma_{\mathrm{ext}}] \\ (\tau_1 \to \tau_2)[\Gamma_{\mathrm{ext}}] &\triangleq \tau_1[\Gamma_{\mathrm{ext}}] \to \tau_2[\Gamma_{\mathrm{ext}}] \end{aligned}$$

Let Subst \triangleq TyVar $\xrightarrow{\text{fin}}$ Type be the set of substitutions. For $S \in$ Subst, define:

$$S \bullet \triangleq \bullet \qquad \qquad S(\tau_1 \to \tau_2) \triangleq S\tau_1 \to S\tau_2$$

$$S(\alpha.p) \triangleq \alpha.p \qquad \text{when } \alpha \notin dom(S) \qquad S(\alpha.p) \triangleq \tau.p \qquad \text{when } \alpha \mapsto \tau \in S$$

$$S([].p) \triangleq [].p$$

Define:

$$\begin{split} (S, \Gamma_{\mathrm{ext}}) \vDash U \triangleq & \forall (\tau_1 \doteq \tau_2) \in U : (S\tau_1)[\Gamma_{\mathrm{ext}}] = (S\tau_2)[\Gamma_{\mathrm{ext}}] \text{ and} \\ & \forall (\tau_1 \succeq \tau_2) \in U : (S\tau_1)[\Gamma_{\mathrm{ext}}] \geq (S\tau_2)[\Gamma_{\mathrm{ext}}] \end{split}$$

where subtyping rules are the same as Figure 12 and subtyping between type variables are not defined. Then we can show that:

Claim 2.2 (Correnctness of V). For $e \in \text{Expr}$, $\Gamma, \Gamma_{\text{ext}} \in \text{TyEnv}$, $\alpha \in \text{TyVar}$, $S \in \text{Subst}$:

$$(S, \Gamma_{\text{ext}}) \vDash V(\Gamma, e, \alpha) \Leftrightarrow (S\Gamma)[\Gamma_{\text{ext}}] \vdash e : (S\alpha)[\Gamma_{\text{ext}}]$$

 $Proof\ sketch.$ Structural induction on e.

Note that by including [].p in type environments, we can naturally generate constraints about the external environment []. Also, by injection, we can utilize constraints generated in advance to obtain constraints generated from a more informed environment. We extend injection to the output of the constraint-generating algorithm:

$$\begin{split} & \bot[\Gamma_{\text{ext}}] \triangleq \bot \\ & U[\Gamma_{\text{ext}}] \triangleq \{\tau_1[\Gamma_{\text{ext}}] \doteq \tau_2[\Gamma_{\text{ext}}] | (\tau_1 \doteq \tau_2) \in U\} \cup \\ & \qquad \qquad \{\tau_1[\Gamma_{\text{ext}}] \geq \tau_2[\Gamma_{\text{ext}}] | (\tau_1 \geq \tau_2) \in U\} \end{split} \qquad \text{when all injections succeed} \\ & U[\Gamma_{\text{ext}}] \triangleq \bot \qquad \qquad \text{when injection fails} \end{split}$$

Then we can prove:

Claim 2.3 (Advance). For $e \in \text{Expr}$, $\Gamma, \Gamma_{\text{ext}} \in \text{TyEnv}$, $\alpha \in \text{TyVar}$:

$$V(\Gamma[\Gamma_{\rm ext}],e,\alpha) = V(\Gamma,e,\alpha)[\Gamma_{\rm ext}]$$

Proof sketch. Structural induction on Γ .
